

## AMRoC Fab Lab Safety Protocols for COVID-19 Related Production

**IMPORTANT:** Please note that while all due diligence is undertaken to maintain the health and safety of end users in the production of COVID-19 related PPE and other equipment and parts at AMRoC Fab Lab, AMRoC is *not* an approved health care device or parts manufacturer.

All of the items produced in the service of COVID-19 relieve efforts are supplemental in nature only, and unless specifically identified or noted on the product, are *not* medical grade solutions that are proven to prevent COVID-19 or other viruses.

The majority of items that AMRoC and most other community organizations are making are stop gap measures during times of inventory shortage, intended to provide some measure of safety and protection when no other resources are available.

To that end, we will do everything possible to produce all needed and requested materials in the safest manner possible.

### Our Procedures

- All production personnel are clear of illness symptoms – no one showing any signs of illness is permitted to volunteer or staff production lines.
- Personnel wash hands frequently and wear appropriate clothing – gloves and masks – during printing and assembly processes.
- 3D printers, sewing machines, related tooling and accessories, and production and assembly areas are sanitized with CDC approved COVID-19 anti-viral products prior to, throughout and after use.
- Finished parts are handled with gloves or tongs and stored in sealed bags or containers, and kept in storage, separately, for a minimum of three days before distribution.
